

Programming with Operators Code

```
# AtlantaPizza.py
```

```
# Ask the person how many pizzas they want, get the number with eval()
```

```
number_of_pizzas = eval(input("How many pizzas do you want? "))
```

```
# Ask for the menu cost of each pizza
```

```
cost_per_pizza = eval(input("How much does each pizza cost? "))
```

```
# Calculate the total cost of the pizzas as our subtotal
```

```
subtotal = number_of_pizzas * cost_per_pizza
```

```
# Calculate the sales tax owed, at 8% of the subtotal
```

```
tax_rate = 0.08 # Store 8% as the decimal value 0.08
```

```
sales_tax = subtotal * tax_rate
```

```
# Add the sales tax to the subtotal for the final total
```

```
total = subtotal + sales_tax
```

```
# Show the user the total amount due, including tax
```

```
print("The total cost is $", total)
```

```
print("This includes $", subtotal, "for the pizza and")
```

```
print("$", sales_tax, "in sales tax.")
```
