

EXTRA APP: ClickRandomDots.py!

Congratulations on completing the main course content! Here's a very special (and really fun) Bonus App to celebrate your achievement! It combines random colors and sizes with Turtle graphics to create a beautiful, interactive drawing app for cartoon dots:

Just 24 lines long, including the comments, but unlimited fun! This app was inspired by my sons Alex and Max, from an app called BubbleDraw in my "Learn Java Like a Kid" course.

The Python source code file is next.

The code is short enough to read and understand in a single sitting, and it reuses concepts from other apps in Chapter 7. The only completely new item is generating a random color as a set of three random values:

```
( random.random(), random.random(), random.random() )
```

We've used colors by name (like "blue" and "red"), but Python also allows you to specify a color by telling it how much Red, Green, and Blue is in the color (we call this an RGB value). Just put three numbers from 0.0 to 1.0 inside parentheses (round brackets), separated by commas, like:

```
(0,0,0) # black(1,1,1) # white(1, 0, 0) # red(0, 1, 0) # green(0, 0, 0.5) # dark blue(1, 1, 0) #  
yellow
```

So, three `random.random()` values from 0.0 to 1.0 will give us the varied colors you see in the screenshot above - cool, huh?

Download and edit the [ClickRandomDots.py](#) file in IDLE, run it, and let me know what you think!

Enjoy, and happy coding!
